

SALES DATA ANALYSIS USING MYSQL

PREPARED BY: KUMAR.S

PROJECT OVERVIEW

- **This project is based on a retail sales dataset taken from Kaggle website which I will be utilizing to analyze business performance using MySQL.**
- **Dataset Source: Kaggle – ‘Sample Supermarket Dataset’**
- **The dataset includes information such as sales, city, category, region, and profit.**
- **The goal is to analyze sales data and extract actionable insights to support better business decision-making.**

KEY ANALYSIS PERFORMED:

1) Sales Performance Analysis:

- Top 5 highest sales transactions
- Sales greater than average
- Top 5 cities with highest total sales based upon region
- Cities starting with 'N' with high total sales

Focus: Identifies high-revenue transactions and top-performing locations.

2) Profit Analysis:

- Total sales and profit by region
- Lowest 10 profit records (negative profit)
- Second highest profit

Focus: Evaluates profitability, detects losses, and compares regional performance

3) Category Performance Analysis:

- Average sales by category (>200)

Focus: Identifies high-performing product categories based on average sales.

4) Customer & Demand Analysis:

- Number of orders per city where no. of orders is greater than 10.
- Cities with 2 'o's in its name and sales above average

Focus: Analyzes customer activity and demand patterns across cities.

1) WAQTD top 5 highest sales transactions details.

```
Query: SELECT *  
        FROM dataset  
        ORDER BY Sales DESC  
        LIMIT 5;
```

- Insight:
- Identifies orders with sales higher than average, helping us to understand which transactions bring more revenue.

3) WAQTD top 5 cities with highest total sales where region is 'East'.

**Query: SELECT City, SUM(Sales) AS "Total Sales"
FROM dataset

- **Insight:**
- Some cities meeting specific conditions (like starting with 'N') contribute above-average sales, indicating strong performance within that segment.
- Highlights that even within filtered cities, some locations perform significantly better than average.

- **Insight:**
- This analysis uses a threshold value of 200 to filter out low-performing categories and focus on categories with higher average sales. This helps businesses focus on better-performing products and make smarter decisions in inventory and marketing.

9) WAQTD number of orders per city where count of no. of orders is greater than 10.

- Insight:
- Demonstrates advanced filtering and helps identify specific high-performing locations based on conditions.
- Note: (This one is mainly to show my SQL skill, but it does not add business value without having a definite context)

Additional SQL Concepts Demonstrated:

- In the upcoming slides I have displayed the queries which have helped me to have practical experience to the apply following concepts:
 1. Data filtering using WHERE, LIKE, BETWEEN, IN
 2. Sorting and limiting results using ORDER BY and LIMIT
 3. Grouping data using GROUP BY
 4. Subqueries for advanced data comparison
 5. Pattern matching and string functions (LIKE, LENGTH)

A) WAQTD Segment, city, and sales where sales > 500, region is 'West', and city starts with 'S'.

Query: SELECT Segment, City, Sales
FROM dataset
WHERE Sales>500 AND Region="West" AND City like "S%";

The screenshot displays a SQL query execution environment. The query is as follows:

```
10 -- 1. WAQTD Segment, city, and sales where sales > 500, region is 'West', and city starts with 'S'.
11 • SELECT Segment, City, Sales
12 FROM dataset
13 WHERE Sales>500 AND Region="West" AND City like "S%";
14
```

Below the query, the results are shown in a table with columns Segment, City, and Sales. The table contains 16 rows of data, all of which are highlighted in blue. The first row is expanded, showing a right-pointing triangle icon.

Segment	City	Sales
Consumer	Seattle	787.53
Consumer	San Diego	3347.37

Below the table, there is a tab labeled "dataset 1" with a close button. The "Output" section shows the "Action Output" table, which contains two rows of execution logs.
